

NewroCare Institute Japan Co. Ltd

Sleep Management System

POWERDREAMING

The PowerDreaming products includes a sleep induction device and a insomnia treatment device; both are based on a groundbreaking core patented technology of Newrocare Institute Japan Co., Ltd., which uses contactless and non-invasive physical methods to modulate brain activity. The sleep induction device is placed under the pillow during use. Once it is switched on, a mild electric field is generated throughout the brain to interact with the mild electric field in the brain, which promotes the full release of sleep hormone in the whole brain, inducing the brain naturally transforming from wake mode to deep sleep mode, making the brain a good quality and high efficiency sleep. In addition to the sleep induction, the insomnia treatment device has a treatment program for insomnia. Insomnia is caused by the neurotransmitters in the brain losing the original balance state. The neurotransmitters control the brain naturally transform from wake to sleep; and once the original equilibrium of neurotransmitters is broken, insomnia happens. The insomnia treatment device modulates brain activities to activate a brain function that restores the original equilibrium of neurotransmitters in the brain, curing insomnia.

DreamTractor

The DreamTractor product is a device that detects the level of sleep hormone release in the brain to measure and monitor the depth of sleep.

VigiLor

The VigiLor product is a device that stops the release of sleep hormone for brain wakefulness and enhances brain attentions.
